

Love it. Here's a punchy, **low-effort/high-impact** enhancement list for the New UI pack you just got—everything below is **DB-free** and can ship immediately. I grouped by payoff.

### ### 1) Navigation & Layout

- \* **Active route indicator** with tiny left border + subtle glow on hover.
- \* **Keyboard shortcuts**: `G L` (Live), `G M` (Meetings), `G S` (Summaries), `G T` (Tasks), `G ,` (Settings); `R` start/stop, `M` marker.
- \* **Responsive sidebar**: slide-in on mobile with backdrop; remember collapsed/expanded state in `localStorage`.
- \* **Command palette** (/Ctrl + K): fuzzy-search routes & recent meetings (uses demo JSON for now).

### ### 2) Live (Record) page

- \* **Waveform strip** (CSS canvas) that reacts to mic level (simulated now; connects to real analyser later).
- \* **Floating capture bar** (bottom dock) with timer, input meter, and big record button + hotkeys.
- \* **Inline markers**: show badge in the transcript gutter; hover → mini note; click → scroll to position.
- \* **“Copy last 15s”** button to copy recent transcript window (useful during calls).
- \* **Skeleton loaders** for first 2s so perceived latency is zero.

### ### 3) Meetings list & detail

- \* **Virtualized list** for meetings (smooth on large lists, even with mock data).
- \* **Card micro-actions**: “Open”, “Summary”, “Share” as icon buttons; **hover reveal** secondary actions.
- \* **Empty states** with helpful CTAs (“Record your first meeting”, “Import from .m4a/.webm”).
- \* **Filters**: date range, participants (mocked), “has tasks/summary” chips.
- \* **Meeting detail (mock)** page: sticky header with title + quick actions, tabs: Transcript | Summary | Tasks | Metrics.

### ### 4) Summaries page

- \* **Style switcher** chips (Executive / Action-only / Engineering / Customer-facing) with live preview.
- \* **Inline copy/export**: copy entire summary; export `.md` (generate blob client-side).
- \* **Diff view** between last two regenerations (mocked now; real later).
- \* **Callouts**: auto-styled “Decisions / Risks / Next steps” blocks.

### ### 5) Tasks (Kanban)

- \* **Drag & drop** between columns (lightweight dnd—no backend required).

- \* **Quick-add** with `Enter` to create, `@` to tag assignee, `#` to add due date (parse text on the fly).
- \* **Task details drawer** (right panel): description, checklists, labels; persists to mock JSON in memory.
- \* **Batch actions**: multi-select + move to column.

#### ### 6) Settings & Personalization

- \* **Theme toggle** (true dark/light) and **system auto** (`prefers-color-scheme`); persist choice.
- \* **Accent color** selector (brand gradient presets).
- \* **Accessibility**: text size scale; reduced motion toggle (disables transitions).
- \* **Hotkey cheatsheet** overlay (press `?`).

#### ### 7) Visual polish & motion

- \* **Consistent elevation scale** (shadows at 0/1/2) and **glass** only on top surfaces.
- \* **Entrance animations**: cards fade-up 40ms stagger; toast slide-in/out.
- \* **Pressed states** with 1px inner highlight (feels tactile).
- \* **Focus rings**: visible, brand-tinted, WCAG-friendly.

#### ### 8) Performance & quality

- \* **Tailwind CDN** → **JIT safelist** (avoid FOUC); prefetch route partials on hover.
- \* **Split `app.js`**: tiny router + page modules; lazy-load per route.
- \* **Error toasts** for failed fetches in demo mode (simulate 5% failure to test UX).
- \* **Analytics hooks (noop)** so we can wire later (page\\_view, click\\_action, shortcut\\_use).

#### ### 9) Packaging & “ready to wire”

- \* **PWA shell** (manifest + offline fallback page) so demos work great on mobile.
- \* **Feature flags** (env-style booleans) to toggle demo mode per page (`window.MINA_DEMO_*`).
- \* **Design tokens** file (JS map) for spacing, radii, brand gradient—single source of truth.

---

If you want, I'll ship a **V2 drop-in pack** that adds:

- \* keyboard shortcuts,
- \* better sidebar/active states,
- \* waveform stub,
- \* markers in gutter,
- \* Kanban drag/drop,
- \* theme + accent toggle,

- \* copy/export for summaries,
- \* skeletons/placeholders,
- \* error toasts and prefetch.

That'll keep everything **\*\*DB-free\*\*** but make Mina feel premium today.

Small note: a few earlier big uploads (branding/PRD PDFs) have expired on my side—if you want the UI to mirror those exactly (colors/wording), re-upload and I'll align the tokens and copy 1:1.

Tell me which items are must-haves for V2, and I'll deliver the **\*\*full, drop-in files\*\*** next message.
